You can install Super Mario Bros. by itself with `pip`:

```
>>> pip install gym-super-mario-bros
```

After it is installed, you can test the environment (e.g., try running this code in a Jupyter Notebook) by playing a random agent and taking random actions. To review how to use the OpenAI Gym, please refer back to chapter 4. In the following listing we instantiate the Super Mario Bros. environment and test it by taking random actions.

**Listing 8.1. Setting up the Super Mario Bros. environment**

```
import gym
from nes_py.wrappers import JoypadSpace
1
import gym_super_mario_bros
from gym_super_mario_bros.actions import SIMPLE_MOVEMENT,
COMPLEX_MOVEMENT 2
env = gym_super_mario_bros.make('SuperMarioBros-v0')
env = JoypadSpace(env, COMPLEX_MOVEMENT)
3

done = True
for step in range(2500):
4
    if done:
        state = env.reset()
    state, reward, done, info = env.step(env.action_space.sample())
    env.render()
env.close()
```

- ***1*** This wrapper module will make the action-space smaller by combining actions together.
