

In the next section we will push our multi-agent reinforcement learning skills to the next level by tackling a harder problem with two teams of agents battling against each other in a game.

9.5. Mixed cooperative-competitive games

If you think of the Ising model as a multiplayer game, it would be considered a pure cooperative multiplayer game, since all the agents have the same objective and their reward is maximized when they work together to all align in the same direction. In contrast, chess would be a pure
