List of Tables

Chapter 2. Modeling reinforcement learning problems: Markov decision processes

- Table 2.1. Example of the side-by-side mathematics and pseudocode we use in this book
- Table 2.2. The expected reward calculation in math and pseudocode
- Table 2.3. Computing the best action, given the expected rewards
- Table 2.4. The softmax equation
- Table 2.5. The policy function
- Table 2.6. The optimal policy
- Table 2.7. The state-value function
- Table 2.8. The action-value (Q) function

Chapter 3. Predicting the best states and actions: Deep Q-networks

- Table 3.1. Q-learning update rule

Chapter 7. Distributional DQN: Getting the full story

- Table 7.1. Frequentist versus Bayesian probabilities
- Table 7.2. Computing an expected value from a probability distribution
- Table 7.3. Common probability distributions
- Table 7.4. The likelihood ratio in math and Python
- Table 7.5. The log-likelihood ratio in math and Python
- Table 7.6. The weighted log-likelihood ratio in math and Python
- Table 7.7. The Kullback-Leibler divergence

Chapter 8. Curiosity-driven exploration
