make the association between the new admin class and the ORM. That's it. One class import and three lines of code gives you a complete set of CRUD pages behind a secure login wall. The following listing shows the code you need inside admin.py to get this all to work.

Listing 5.1 The `MusicianAdmin` class

```
# RiffMates/bands/admin.py
from django.contrib import admin

from bands.models import Musician

@admin.register(Musician)
class MusicianAdmin(admin.ModelAdmin):
    pass
```

Import your Musician class from models.py.

Use the register() function as a class decorator to associate the admin class with the model.

Inherit admin.ModelAdmin.

Use the inherited class without additional changes.

Fire up your development server, and return to the Django Admin Home page: http://localhost:8000/admin/. The page now has a new section for the Bands app and contains links to add a `Musician` object, and view the Musician Listing page. Go ahead and click Musicians to view the page, which contains a listing with the data you created in chapter 4. The result is similar to figure 5.5. The listing page has a navigation menu on the left-hand side similar to the home page; it is collapsible; and for the sake of space, I have collapsed it. The small chevron (») icon can be clicked to expand the nav.

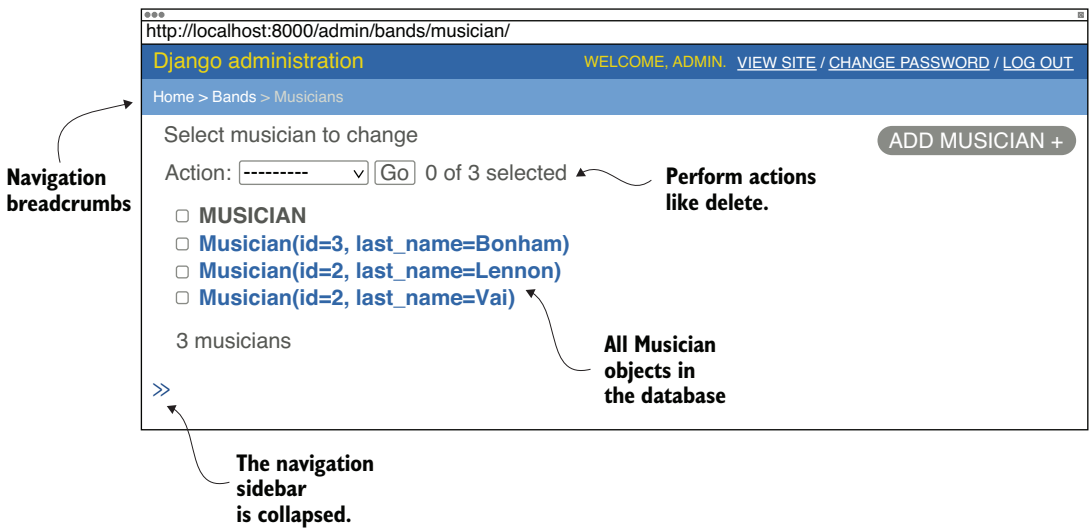

Figure 5.5 Listing page showing all `Musician` objects in the database and corresponding CRUD operations
