Listing 5.2 Customized `MusicianAdmin` class with three columns

```
# RiffMates/bands/admin.py
from django.contrib import admin
from bands.models import Musician

@admin.register(Musician)
class MusicianAdmin(admin.ModelAdmin):
    list_display = ('id', 'last_name', 'show_weekday')

    def show_weekday(self, obj):
        # Fetch weekday of artist's birth
        return obj.birth.strftime("%A")
    show_weekday.short_description = "Birth Weekday"
```

The listing page has three columns.

The date format "%A" is for the weekday.

Callable in list_display, invoked for each Musician object in the listing.

Customize the column title.

With these changes in place, start your development server, and visit the `Musician` class's listing page. It now looks like figure 5.7.

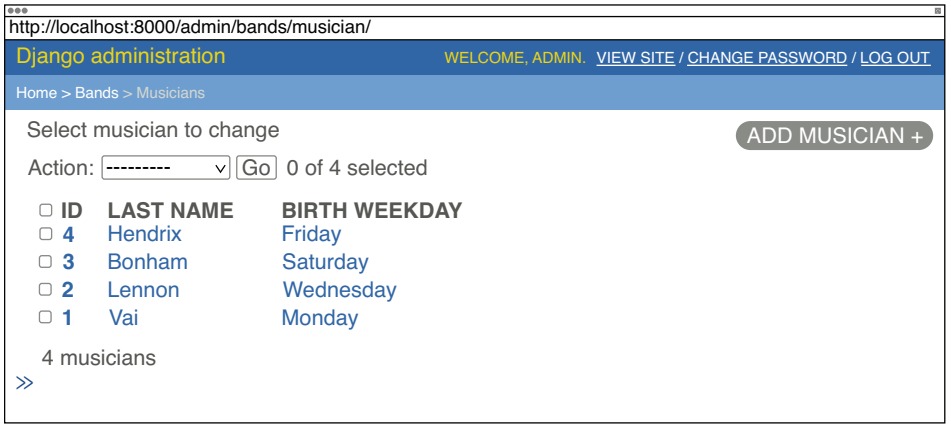

Figure 5.7 Customized `Musician` listing page

5.2.1 Sorting and searching

It isn't obvious unless you mouse over them, but the column headers in the listing page are clickable. Clicking a column sorts it, in ascending order. Once a column gets sorted, a mouse-over reveals a toggle to turn sorting off. You can sort by multiple columns, allowing "first sort-by then sort-by" ordering. A small number shown in the header indicates the sorting precedence. Sorted columns also feature a small triangle that changes from ascending to descending sort order when clicked.

Sorting is performed at the database level for efficiency. You haven't seen it yet, as you only have four objects, but the Django Admin supports pagination. If you have a lot of objects, Django doesn't load them all into memory to perform the sort but gets
