Django provides you a base class for defining stacked inline forms, called `admin.StackedInline`. After inheriting from this class and pointing at the associated user profile, Django Admin takes care of the rest. This new form gets associated with the `User` object admin form by creating a new class in your admin.py file. This `UserAdmin` class inherits from the built-in admin class for a `User` and adds the new stacked inline form to an attribute called `inlines`. Finally, you replace the default class by unregistering it and registering your new one. Add the code in the following listing to your RiffMates/bands/admin.py file.

Listing 6.2 Code for managing your `UserProfile` class through the Django Admin

```
# RiffMates/bands/admin.py
...
from django.contrib.auth.admin import UserAdmin as
➥ BaseUserAdmin
from django.contrib.auth.models import User
...
from bands.models import Musician, Band, Venue, Room,
➥ UserProfile
...
class UserProfileInline(admin.StackedInline):
    model = UserProfile
    can_delete = False

class UserAdmin(BaseUserAdmin):
    inlines = [UserProfileInline]

admin.site.unregister(User)
admin.site.register(User, UserAdmin)
```

Import and rename UserAdmin, so it can be replaced.

Import Django's User object.

Add the UserProfile object to the list of imported models.

Create a form by inheriting from admin.StackedInline.

Associate the stacked inline form with the UserProfile object.

Create a new object to admin the User model, inheriting from the original.

Use the new UserProfileInline class as a stacked form.

Remove the old admin object for the User, and add the UserAdmin as its replacement.

With the model and admin code changes done, you're ready to test it out. As the `UserProfile` object is a new ORM Model, you need to run the `makemigrations` and `migrate` management commands. Once you've done that, run the development server, and then log in to the Django Admin by visiting http://localhost:8000/admin/, using your superuser credentials.

Once you're on the Django Admin home page, click Add next to the Users object control in the left-hand nav. Let's create an account for your cousin Nicky. Figure 6.3 is a simplified representation of the Django Admin Add User screen. It is divided into two sections: one for account information and the stacked-inline form with your user profile data. The actual Add User screen has more details on it, including information about how to choose a proper password, how to multiselect Musicians, and more, but I've left that out in the diagram to reduce clutter.

You create Nicky's credentials by filling in the username field (*nicky*) and choosing a password. This is also where you can associate Nicky's account with one or more `Musician` or `Venue` objects. For our purposes, associate Nicky with the CBGB venue
