

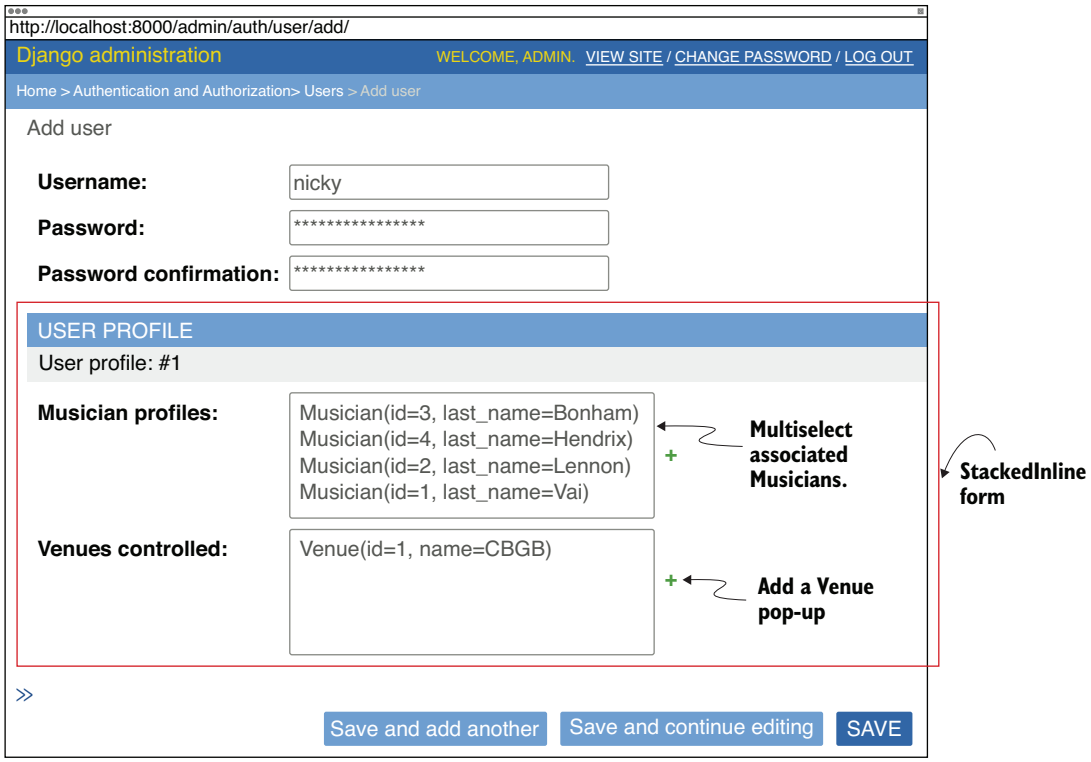

Figure 6.3 Simplified version of the Django Admin Add User screen

and nothing else. If you don't do this, some of the code later will crash. You'll learn why and how to prevent the problem before the end of the chapter.

When you click Save, you are taken to another version of the Add User screen with even more information on it. The Django Admin splits account creation into a two-step process. The first step creates the username and password, while the second step allows you to fill in more information about the user and manage their permissions. If you want to make Nicky an admin or staff member, this second page is where that is done. There are also fields for managing permissions. The chapter on the Django Admin introduced the idea of a staff member being someone with access to the Django Admin but not necessarily permissions to do everything. The permission fields on this second screen are where you control this access. This isn't a feature I ever take advantage of, personally. I tend to keep my sites simple: you're either an admin or not.

Now that Nicky's account has been created, you can do exactly nothing with it. The login you have been using so far is only for the Django Admin. If Nicky isn't a superuser, she can't log in. Before playing with nonsuperuser account logins, you'll need a view that has restricted access.
