7 Forms, user data, static files, and uploads

This chapter covers

- Writing views that handle form submissions
- Using the `Form` class to write web forms
- Cross-site request forgery (CSRF) protection
- Using the `ModelForm` to create forms based on `Model` classes
- Writing views that handle file uploads
- Providing access to both uploaded and static files

This chapter covers content handled by your website over and above a simple view. It starts out by showing you how to receive user input data through web forms, and then it moves on to dealing with files. Files can be uploaded by your users, and if they are, those same files can be downloaded or shown on a page. There are also files you include in your site that aren't served by Django: CSS, images, JavaScript, and more. This chapter covers how to deal with user data and all kinds of file input and output as well as how to do it to manage it all securely.
