```
            raise ValidationError(
                "Band field required when seeking a musician")
    ...
```

The `SeekingAd` model needs two more fields: an `owner` and a `date`. The `owner` field is a foreign key to a `User` account to track who created the ad. This is especially important if you want to provide the ability to edit ads, as only the owner should be able to edit it. The `date` field tracks when the ad got created. Conveniently, `DateField` has an optional argument called `auto_now_add` that, when set to `True`, automatically populates the field with the current date. (There is also another option, `auto_now`, that gets populated whenever the object gets saved.) The Django Admin is aware of this and won't even prompt you for the field—it lets the model set it for you. The following listing puts all these pieces together. You'll need a new models.py file in the RiffMates/content app directory.

Listing 7.5 The `SeekingAd` model stores a RiffMates classified ad

```
# RiffMates/content/models.py
from django.contrib.auth.models import User
from django.core.exceptions import ValidationError
from django.db import models

from bands.models import Musician, Band

class MusicianBandChoice(models.TextChoices):
    MUSICIAN = "M"
    BAND = "B"

class SeekingAd(models.Model):
    date = models.DateField(auto_now_add=True)
    owner = models.ForeignKey(User,
        on_delete=models.CASCADE)
    seeking = models.CharField(max_length=1,
        choices=MusicianBandChoice.choices)
    musician = models.ForeignKey(Musician, on_delete=models.SET_NULL,
        blank=True, null=True)
    band = models.ForeignKey(Band, on_delete=models.SET_NULL,
        blank=True, null=True)
    content = models.TextField()

    class Meta:
        ordering = ["date", ]

    def __str__(self):
        return f"SeekingAd(id={self.id}, seeking={self.seeking})"

    def clean(self):
        if self.seeking == MusicianBandChoice.MUSICIAN:
            # Validate seeking musician case
            if self.band is None:
```

Extending TextChoices allows you to write a choices object, like an enumeration class.

Using auto_now_add=True means this field gets automatically populated with the current date when the object gets created.

A CharField using the choices argument, so seeking can only contain "M" or "B", indicating whether a musician or band is being sought.

A foreign key to the user who owns the ad

A foreign key relationship to the musician seeking a band. The arguments blank=True and null=True ensure this can be empty in both the Django Admin and the database.

A foreign key relationship to the band seeking a musician

Storage for the text of the ad

Default query order is by the date field

Validation for inter-field dependencies gets done in the .clean() method.

When seeking a musician, ensure the band field gets populated and the musician field is empty.
