Remember that list_ads.html divides the ads into two sections: one for musicians seeking bands and the other for bands seeking musicians. In both these cases, the Edit links need to be added in the template.

Another worthwhile change to this template is to add a link for new ads, but only if the user is authenticated. Put this near the top of the file:

```
{% if request.user.is_authenticated %}
    <a href="{% url 'seeking_ad' %}">New Ad</a>
{% endif %}
```

Although `is_authenticated()` is a method on the User object, remember that templates can call methods if they take no arguments.

With the changes to the view, the new route registered, and the tweak to your template, you're ready to go. Run your development server, and visit the ad listing page. You should now have Edit links for ads owned by the authenticated user, which take you to the Edit mode of the ad view.

7.3 Serving static files

All the content so far was from dynamic web pages output from Django views. There are two more types of content that your project may include: static files and user uploaded files. *Static files* are those that don't change and are typically related to the presentation layer. CSS, JavaScript, and images on the site are common examples of static files. Django has not been optimized to serve this kind of content, so in production, it should be delegated to a web server. The Django development server does have an inefficient static serving mechanism, so you don't have to use a separate web server when testing your site. The details about static file serving in production get covered, with all the other bits about production, in appendix B.

Because of the minimal understanding of technology (MUT; patent pending, offer may not be valid in your area) approach taken so far, a core piece of RiffMates is missing: a home page. Let's throw together a basic home page that has an image file: the RiffMates logo.

I'll leave it to you to create a view for the home page; it should go in the RiffMates/home/views.py file and really only needs to contain a single call to `render()`. There is one small thing to be aware of when registering a home page view: the relative URL portion of the `path` is an empty string. Modify your RiffMates/RiffMates/urls.py file to include the following route:

```
# RiffMates/RiffMates/urls.py
...
urlpatterns = [
    ...
    path("", home_views.home, name="home"),
]
```

An empty path string registers a view against the base URL.

The logo image is a static file. The location of static files is typically different in development and production. Both the URL and the absolute path to the file are usually
