Listing 7.19 Template for adding or editing a `Venue` object

```
<!-- RiffMates/templates/edit_venue.html -->
{% extends "base.html" %}

{% block content %}
<h1>Venue Details</h1>

<form enctype="multipart/form-data" method="post">
  {% csrf_token %}
  {{form.as_p}}
  <button class="btn btn-dark" type="submit">Save</button>
</form>

{% endblock content %}
```

Make sure to include the enctype argument, or file uploads won't work.

You're more or less there, but for ease of use, it would be nice to provide links for the user. Inserting an Add Venue link in the venues.html template is just a single line of HTML. Providing Edit links that only show up if the user is associated with the venue means a bit more work.

Inside the existing `venues()` view, you can annotate each `Venue` object with an attribute indicating whether the user is associated with the venue. This might seem a little weird, as you're inserting an attribute on a model, but models are just objects, and Python lets you add attributes to objects dynamically. This has no effect on the database, and the lifetime of the attribute is only the lifetime of the view. Inside RiffMates/bands/views.py, modify the `venues()` view to include the code in the following listing.

Listing 7.20 Adding info about user's logged-in status to `Venue`

```
# RiffMates/bands/views.py
...

def venues(request):
    all_venues = Venue.objects.all().order_by("name")
    for venue in all_venues:
        # Mark the venue as "controlled" if the logged in user is
        # associated with the venue
        profile = request.user.userprofile
        venue.controlled = \
            profile.venues_controlled.filter(\
            id=venue.id).exists()
    ...
```

A previously existing line in the view querying all Venue objects

New code that loops through each of the Venue objects to add a new attribute

A quick reference to shorten the following line

Even with the previous reference, this line is unwieldy. The .exists() query returns True if the Venue object is in the user's venues_controlled relationship.

Inside the template, the short-lived `.controlled` attribute is used to determine whether an edit link should be shown. The changes to the venue listing template are shown in the following listing. Open and edit RiffMates/templates/venues.html.
