Listing 7.21 Modifications to the venue listing template

```
<!-- RiffMates/templates/venues.html -->
<!-- ... -->

  <h1>Venues</h1>

  {% if user.is_authenticated %}
    <a href="{% url 'add_venue' %}">Add Venue</a>
  {% endif %}

<!-- ... -->
      <li>
        <b> {{venue.name}} </b>
        {% if venue.controlled %}
          <br/>
               
          <a href="{% url 'edit_venue' venue.id %}"
            >Edit</a>
          <br/>
        {% endif %}
        {% if venue.picture %}
          <br/>
               
          <img src="{{venue.picture.url}}" height="50"/>
          <br/>
        {% endif %}
        {% if venue.description %}
          <br/>
          <i>       {{venue.description }} </i>
          <br/>
        {% endif %}
        Rooms:
      </li>
```

If the user is logged in, provide a link for adding a venue.

Reference the named route for adding a venue, which points at the edit_venue() function but uses the default argument of venue_id=0.

If the venue is controlled by the user, provide an Edit link.

Reference the named route for editing a venue.

If the venue has a picture, display it.

If the venue has a description, display it.

You're all set. Fire up your development server, and go to the venue listing page. If you're logged in, you'll now have the Add Venue link. Use that link to add a new venue, including a picture and a description. Log in as someone else, and do it again. On the Venue listing page, you should only see Edit Venue for those venues associated with the current user account. Test out the editing feature by clicking the link and changing the form.

Bug alert!

The changes to `venues()` in chapter 7 work if you are logged in. If you're not logged in, the code crashes. The view accesses the user's associated profile object, which only exists for authenticated users. Recall that Django refers to unauthenticated users as anonymous. These users are represented in a `request` object with an instance of an `AnonymousUser` class, whose `.is_authenticated` attribute is always `False`. This class has no related `UserProfile` object, and attempting to fetch one will result in an error.

To fix `venues()`, you need to make a decision. If you don't want anonymous users to be able to access the venue information, you can wrap the view with
