- Static files should be served by the web server rather than Django, but Django provides utilities for managing them and their URLs. The `{% static %}` tag dereferences the URL for a static file.
- Django has the ability to deal with uploaded files, storing them in a directory defined by the `MEDIA_ROOT` configuration value.
- The `FileField` and `ImageField` ORM fields store references to a file on the disk.
- A model with file fields can be used with a `ModelForm`, producing an upload button in the HTML.
- The `<form>` tag for a form including file uploads must include the `enctype="multipart/form-data"` argument.
- When using a `ModelForm` with uploaded files, the `request.FILES` argument needs to be passed in addition to `request.POST`.
