- The `.client.post()` method takes a dictionary representing the form data included for an HTTP POST call. It recognizes file handles and puts them in the appropriate part of the request object.
- To test pages that require authentication, your `TestCase` class needs to create at least one user account in the test database. The `.client.login()` method allows you to log in as a user before visiting a page.
- `SimpleFileUpload` allows you to create an in-memory representation of a file that can be used to test views that handle file uploads.
- `LiveServerTestCase` and `StaticLiveServerTestCase` run the Django development server, so you can test with click-and-record tools, such as Selenium.
- There are many third-party libraries that can help both your testing and ensuring your code meets common quality conventions.
