files. Managing changes to your models can be a bit complicated, and this chapter dives deeper into the migration system.

To better understand what happens during the migration process, it is time to create a new Django app. This app won't have much functionality in it, and for now, it won't even have any views, but by working with a fresh model file in a new app, you'll be able to see exactly what happens at each step in the migration process.

A lot goes on in the music industry besides music. There are some very big names that you've likely never heard of, without whom you might never have known your favorite bands. Promoters and managers are the people behind the scenes that make concerts happen and help bands fulfill their musical dreams. Our new Django app tracks promoters. To create the new app, you'll need to run the `startapp` management command, passing it `promoters` as an argument. You'll then also need to update `INSTALLED_APPS` in settings.py to register the app with your project. For a refresher on creating new apps, see chapter 2.

Throughout this chapter, you'll be modifying the `Promoter` model and examining the resulting migration files. You need to start this journey somewhere, so create a `Promoter Model` with a first and last name field to store the promoter's info. Add the code in the following listing to models.py in your new promoter app.

Listing 10.1 A short `Model` to use as a starting point for investigating migrations

```
# RiffMates/promoters/models.py
from django.db import models

class Promoter(models.Model):
    first_name = models.CharField(max_length=25)
    last_name = models.CharField(max_length=25)
```

You'll want some data in your database. The easiest way to do this is to build a `ModelAdmin` object for `Promoter`, and then use the Django Admin to enter some data. The following listing shows a simple `PromoterAdmin` object you can use to do data entry. For a refresher on the Django Admin and its classes, see chapter 5.

Listing 10.2 An Admin Model for the new Promoter object

```
# RiffMates/promoters/admin.py
from django.contrib import admin

from promoters.models import Promoter

@admin.register(Promoter)
class PromoterAdmin(admin.ModelAdmin):
    list_display = ("id", "first_name", "last_name", )
```
