To save you the effort of digging through Wikipedia, table 10.1 has the data for four famous promoters you can use in this chapter.

Table 10.1 Music industry promoters you can use to populate your database

Name	Famous For	Lifetime
Allan Williams	The Beatles	1930/02/21–2016/12/30
Harvey Goldsmith	Live Aid	1946/03/04–
Phoebe Jacobs	Duke Ellington, Ella Fitzgerald	1919/06/21–2012/04/09
Michael Lang	Woodstock	1944/12/11–2022/01/08

Of course, to be able to enter the data, you need the corresponding tables in the database to exist. You'll recall from chapter 4 that you accomplish this by creating migration files and migrating them. To create a migration script, you use the `makemigrations` management command:

```
(venv) RiffMates$ python manage.py makemigrations promoters
Migrations for 'promoters':
  promoters/migrations/0001_initial.py
    - Create model Promoter
```

The makemigrations management command takes the name of a Django app as an argument.

When run, the command reports that a new file has been created: promoters/migrations/0001_initial.py. Django uses this file to know which actions to perform on the database corresponding to changes in the `Promoter` class. The action required for a new model is table creation. Running the `migrate` management command causes this to happen:

```
(venv) RiffMates$ python manage.py migrate
Operations to perform:
  Apply all migrations: admin, auth, bands, content, contenttypes,
      promoters, sessions
Running migrations:
  Applying promoters.0001_initial... OK
```

Once you've performed the migration, the table for `Promoter` gets created. You can now use the Django Admin to enter some data. Go do that now, and I'll wait for you here. (See, that's funny because this is a book, and I'm not really here waiting at all. A joke isn't a good one unless you explain it.)

10.1.1 An initial migration

Nothing covered so far is new. You already knew how to create an app, create a new `Model` class with corresponding migration files, and migrate it to the database. In fact, you're probably also accustomed to my odd sense of humor by this point as well.

Although you've done migrations before, they've kind of been magic. It's time to look behind the curtain. It might seem an obvious point to make, but migration files
