For the sake of brevity, I'll leave it to you to create the first version of RiffMates/templates/search_musicians.html. It only needs a `{% for %}` tag to loop over the resulting musicians.

Once you've written the proof-of-concept template, add a route for the new search view in RiffMates/bands/urls.py, and then test your view by calling http://localhost:8000/bands/search_musicians/?search_text=J V. (Yes, that space in the URL will work in your browser.) If your data is the same as mine, you'll get back John Bonham, Jimi Hendrix, John Lennon, and Steve Vai. The first three match the *J* with the first name field, while Steve Vai is a match for the *V* on the last name field.

With the initial view in place, let's add some HTMX. The real version of the page has an `<input>` tag for entering the search terms and an area where results get appended. The results area gets populated using an infinite scroll mechanism, meaning smaller sets of results are returned by the server, and as the user scrolls down on the page, more results are added. This is an efficient way of doing things, especially if there are a lot of results. It is essentially pagination without the user having to click Next Page. In case that's not fancy enough, we're also going to update the browser's URL as the user types in their search terms. Doing this means the search can be bookmarked or shared between users as a deep link. One complication of this feature is that the initial view of a deep-linked page must render search results. So either the initial render or an infinite scroll event can add results to the page. Figure 12.2 outlines the end goal of our search page.

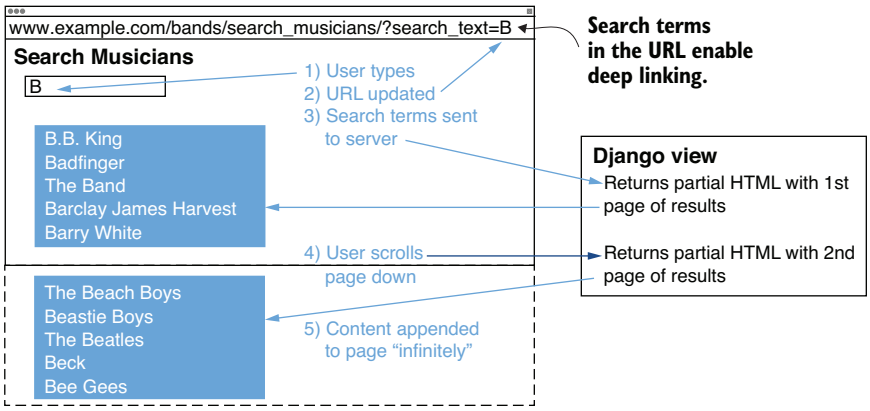

Figure 12.2 A search-as-you-type page with infinite scroll and deep linking

Let's start building the page by adding the `<input>` tag, which uses an `hx-get` attribute, sending the search terms to the server when the user types. You connect typing with a GET call through the `hx-trigger` attribute. A value of `hx-trigger="keyup"` causes GET to be performed when a key gets pressed and released.
