```
        "room": room,
        "form": form,
    }

    return render(request, "partials/edit_room_form.html", data)
```

Render the room editing form as a partial.

The partial for the room-editing form is similar to the forms you built in chapter 7. The following listing shows the form, which uses an `hx-get` to cancel the editing action, and an `hx-post` to submit the form.

Listing 12.17 The HTML form for editing a room

```
<!-- RiffMates/templates/partials/edit_room_form.html -->
<li id="room-row-{{room.id}}">
    <form>
      {% csrf_token %}
      {{form.as_p}}
      <button
            hx-post="{% url 'edit_room_form' room.id %}"
            hx-target="#room-row-{{room.id}}"
        >Save</button>
      <button
          hx-get="{% url 'show_room_partial' room.id %}"
          hx-target="#room-row-{{room.id}}"
        >Cancel</button>
    </form>
</li>
```

All forms require CSRF protection; see section 7.1.2, on CSRF, for more details.

Render the RoomForm object as a <p> tag.

Submit the form, using hx-post.

When triggering the POST, replace the parent <li> tag with the response.

Cancel editing the form by fetching the display information with hx-get.

The beauty of HTMX is its similarity to regular Web 1.0 HTML coding. The form handling here uses the same patterns you used in chapter 7, but with the `hx-` attributes, the behavior becomes dynamic within the page.

The only thing you're missing now is the view called when cancelling the edit form. This view displays the existing room info partial template. The following listing shows this view.

Listing 12.18 An HTMX view for handling a room editing form

```
# RiffMates/bands/views.py
...
@login_required
def show_room_partial(request, room_id):
    room = get_object_or_404(Room, id=room_id,
        venue__userprofile=request.user.userprofile)

    data = {
        "room": room,
    }

    return render(request, "partials/show_room.html", data)
```

Completing the `@login_required` security check and validating the room is associated with the user aren't strictly necessary here, as the user can get the same information from the public venue listing page built in the exercises in chapter 4. I prefer the
