- Django Waffle has three kinds of conditional `Model` classes: switches, samples, and flags.
- A Waffle `Switch` is a global flag, while a `Sample` is on for a percentage of visitors.
- A Waffle `Flag` allows you to determine which visitors see a feature, depending on their role, account, language, group, and additional factors.
- A static website is one for which the URL maps directly to a file getting served.
- Static site generators are tools that use templates to build static sites.
- Django Distill overrides the `path()` function to allow you to output a subset of your project as a static site. This means you can use your existing knowledge of Django's templating instead of learning another tool's syntax.
