For almost all third-party libraries, that's everything you need to know. As you might have guessed from the *almost* in that sentence, the Debug Toolbar is an exception. As you don't want your debug information leaking into your production code, the Debug Toolbar is sensitive to the value of `INTERNAL_IPS` in settings.py. To ensure the Toolbar can only be used locally, the IP address of localhost must be in `INTERNAL_IPS`:

```
# RiffMates/RiffMates/settings.py
...
INTERNAL_IPS = [
    # ...
    "127.0.0.1",
    # ...
]
```

This kind of additional setting is why it is important to read the library's documentation: simply assuming you can get away with `pip install` and adding the module to `INSTALLED_APPS` is a recipe for problems if the library is more complex than that.
