appendix C
Django template tag and filter reference

This appendix is a reference guide for the built-in tags and filters available in the Django template language. For a full reference, see the online documentation: https://docs.djangoproject.com/en/dev/ref/templates/builtins/.

C.1 Tags

Table C.1 Built-in Django template tags

Tag	Description

`{% autoescape off %}`
`  {{ venue_listing }}`
`{% endautoescape %}`
	By default, Django escapes characters in variables that are reserved for HTML. The `{% autoescape %}` tag allows you to control this behavior by turning it on or off for a block. In this example, if `{{ venue_listing }}` contained HTML tags, they could be rendered without being escaped inside `{% autoescape off %}`.
	`{% autoescape %}` expects an argument of either `on` or `off`.

`{% block footer %}`
`  {{ block.super }}`
`{% endblock %}`
	Declare a block to be used in inheritance. Templates that extend other templates can override the contents by declaring a `{% block %}` with the same name—`footer`, in this example. Within a block, a special variable `{{ block.super }}` is available that contains the content of parent block.

`{% comment "Optional note" %}`
`  This content is not rendered`
`{% endcomment %}`
	The contents of a `{% comment %}` block are not included in the rendered content. This tag takes an optional argument that can be used as an additional note, which can be handy if you're commenting out a chunk of code and want to remind yourself why you did so. Comment blocks cannot be nested.
	The template language also supports the {# and #} pair as comment characters.
