C.2 Filters

Table C.3 Built-in Django template filters

Filter	Description
`{{ value|add:"2" }}`	This adds the argument (`2`) to the contents being filtered. It supports variables as an argument. If both the filtered value and the argument are lists, the lists will be concatenated (their values aren't added).
`{{ value|addslashes }}`	This adds backslashes before quote characters in a string. It is used to write content that is escaped, so the user can copy it to the clipboard.
`{{ value|capfirst }}`	This capitalizes the first character.
`{{ value|center:"15" }}`	This adds whitespace to center the contents for the given width. Note: this is only visible in HTML inside certain tags, as HTML normally ignores whitespace.
`{{ value|cut:" " }}`	This removes characters in the argument from the value. The example removes all spaces in the value.
`{{ value|date:"Y/m/d" }}`	This formats the value as a date using the given date specifier string. Specifiers can be found in the docs: https://docs.djangoproject.com/en/dev/ref/templates/builtins/#date.
`{{ value|default:"nothing" }}`	If `value` evaluates to `False`, it renders the contents of the filter's arguments instead.
`{{ value|default_if_none:"nothing" }}`	If `value` is `None`, it renders the contents of the filter's arguments instead.
`{{ value|dictsort:"name" }}`	This sorts a list of dictionaries, using the argument's key. In the example, a list of dictionaries in `value` would be sorted by the `"name"` key.
`{{ value|dictsortreversed:"name" }}`	This sorts a list of dictionaries in reverse order, using the argument's key.
`{{ value|divisibleby:"3" }}`	This returns `True` if `value` is divisible by the argument.
`{{ value|escape }}`	This performs HTML character escaping on `value`. If escaping has already been done on `value` it does not double-escape.
`{{ value|escapejs }}`	This performs JavaScript character escaping on `value`. It does not make the content safe for use as HTML.
`{{ value|filesizeformat }}`	This renders numbers using file size suffixes. For example, `123456789` is rendered as `117.7 MB`.
`{{ value|first }}`	This renders the first item in a list.
