appendix D
Django ORM field reference

This appendix is a reference guide for Django's built-in Database ORM fields. For a full reference, see the online documentation: https://docs.djangoproject.com/en/dev/ref/models/fields/.

D.1 Field options

Table D.1 contains the constructor arguments that can be used in all ORM field types.

Table D.1 Arguments common to all fields

Argument	Description
`null`	When `True`, empty values are stored in the database as NULL.
`blank`	When `True`, the value is allowed to be blank. Note: this is different from `null`, which is related to database storage. This field is used during field validation—for example, in the Django Admin.
`choices=[("en", "English"), ("fr", "French")]`	If present, this argument restricts the values allowed. The restriction is applied during the Model's validation step. The argument takes a sequence of `tuples`, with the first item in each tuple being what is stored in the database (`"en"` or `"fr"`) and the second item in each tuple being the value displayed to the user (`"English"` or `"French"`) in forms, including the Django Admin.
`db_column`	This is used to force the name of the database column; when it is not given, Django bases the column name on the field's name.
