Table D.1 Arguments common to all fields

Argument	Description
`db_comment`	This sets the column comment, if supported by the database.
`db_index`	When `True`, this creates a database index for this column. To index across multiple columns, use the `Meta.indexes` property instead.
`db_tablespace`	The name of the database tablespace to be used if this field is indexed.
`default`	This is a default value for this field if no value is provided at construction. This can also be a callable—if so, it is called for each construction of a new object.
`editable`	When `False`, this field is not displayed in forms or the Django Admin and is ignored during `Model` validation. It defaults to `True`.
`error_messages`	If provided, this overrides the field's default error messages. It takes a dictionary with a message per key. Error message keys are `null`, `blank`, `invalid`, `invalid_choice`, `unique`, and `unique_for_date`. Other keys may be available for specific `Model` fields.
`help_text`	This provides extra help text to be displayed in forms for this field.
`primary_key`	When `True`, this marks the field as the primary key in the model. By default, the primary key is the ID field automatically added by Django.
`unique`	When `True`, each instance in the table must be unique from all others. Unique fields are automatically indexed.
`unique_for_date`	This takes the name of another field in the model of type `DateField` or `DateTimeField` and ensures the value in this field is unique for that date. For example, the value of a title field must be unique for a corresponding publication date.
`unique_for_month`	This is similar to `unique_for_date` but only restricts the month portion of the corresponeing date field.
`unique_for_year`	This is similar to `unique_for_date` but only restricts the year portion of the corresponeing date field.
`verbose_name`	This provides a human-readable name for the field. If not given, Django generates a value based on the field's name.
`validators`	This provides a list of validators to run for this field. For a full list of Django validators, see https://docs.djangoproject.com/en/dev/ref/validators/.
