Your first app, containing your first view, will be named *home*. It will contain your project's Home page, About page, and other similar content.

2.4 Your first Django app

Normally, when building software, it is a good idea to build a minimally viable product (MVP). You want feedback on your code as quickly as possible, and the sooner you get in front of users, the sooner you can adapt to their needs. Instead of taking an MVP approach, here you'll be taking an MUT approach. What's MUT (besides something I just made up)? It is *minimal understanding of technology*. Instead of approaching your site with the best bit of customer functionality, here, you'll be taking an approach based on the minimal amount of understanding you need to get things going. As such, the first web page you're going to build for RiffMates is the Credits page. It's not terribly exciting, but it requires the least amount of work to build.

You've already got the RiffMates project in place, but almost all your project's code goes in a Django app, so you'll need to create one. The manage.py script in your project folder is the entry point to Django *management commands*. A management command is something you'd like to do with Django on the command line. Django comes with many commands. You can even write your own—there's an entire chapter on how to do this!

To create an app in your project, you use the `startapp` management command. This command creates a directory for your app and the needed stub files, including views.py, where you will be writing your first view. Inside your project directory, create the home app by running the following:

```
(venv) RiffMates$ python manage.py startapp home
```

The `startapp` command is the strong silent type and returns without any response—it did do the work though. Your project directory tree now contains the home directory and the app skeleton files:

```
RiffMates/
├── RiffMates
│   ├── __init__.py
│   ├── asgi.py
│   ├── settings.py
│   ├── urls.py
│   └── wsgi.py
├── home
│   ├── __init__.py
│   ├── admin.py
│   ├── apps.py
│   ├── migrations
│   │   └── __init__.py
│   ├── models.py
│   ├── tests.py
│   └── views.py
└── manage.py
```
