```
def credits(request):
    content = "Nicky\nYour Name"

    return HttpResponse(content, content_type="text/plain")
```

Define a function used as a view, taking an HttpRequest object as a parameter.

The content to be displayed as two lines separated by the carriage return symbol (\n)

Return an HttpResponse object with the content and its mimetype.

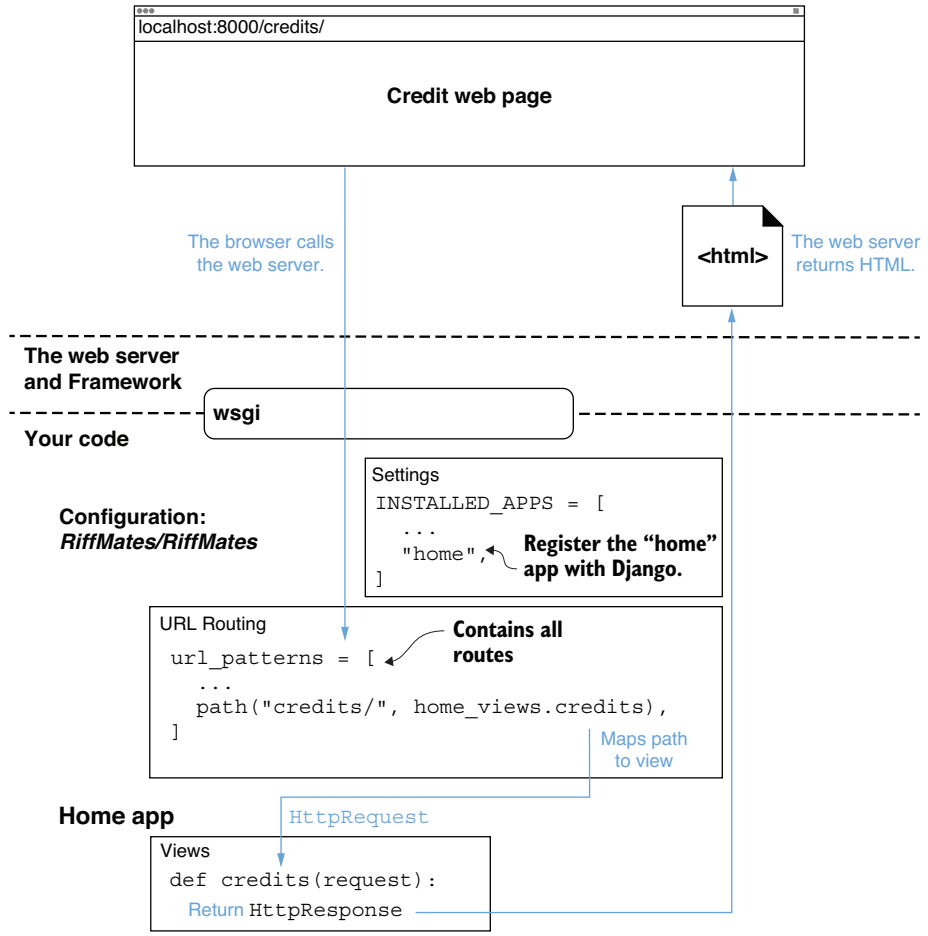

Figure 2.4 The `credits()` view within your *RiffMates* Django project

You're not quite done yet. Although you have a view, you haven't mapped it to a URL. You do that by modifying urls.py.
