3 Templates

This chapter covers

- Managing HTML-like code through templates
- Rendering templates based on context data
- Template tags and filters
- Using the `render()` shortcut inside views
- Composing and inheriting templates for HTML reuse

This chapter introduces you to adding HTML content to your website. Django includes a templating engine that can compose and control text content, allowing you to create reusable pieces of HTML, managing it like you would manage your code.

3.1 Where to use templates

In the previous chapter, you learned how to start a simple website by creating a Django project. Inside the project, you created your first app and your first view. To keep things simple, an important thing got left out: HTML. A website isn't much of a website without it. The purpose of a Django view is to return content, typically for
