**Listing 3.5 Adding a view for the news page**

```
# RiffMates/home/views.py
from django.shortcuts import render
...
def news(request):
    data = {
        'news':[
            "RiffMates now has a news page!",
            "RiffMates has its first web page",
        ],
    }

    return render(request, "news.html", data)
```

Like all views, `news()` must be registered as a route. You need a `path` object inside RiffMates/RiffMates/urls.py for the `news()` view, similar to how you did for `credits()`. Add the new `path` object to `urlpatterns`, like in the following listing.

**Listing 3.6 Registering the `news()` view as a route**

```
# RiffMates/RiffMates/urls.py
...
urlpatterns = [
    ...
    path('news/', home_views.news, name="news"),
]
```

New path object mapping "/news/" to the news() view

The `render()` shortcut in the `news()` view looks for an HTML template named news.html. Before creating that template, you must tell Django where to look for templates. You do this by modifying the `TEMPLATES` configuration in RffMates/RiffMates/settings.py. The `TEMPLATES` value is a dictionary containing four keys that control how templates work in Django:

- `BACKEND` *specifies which template engine to use in your project.* Django ships with the original Django Template Engine as well as a popular third-party template engine, named Jinja2. You can also install other third-party engines if you prefer. I'll be sticking with the default throughout this book.
- `DIRS` *is a list of directories in which Django looks for templates.*
- `APP_DIRS` *is a Boolean value.* When `True` (the default), Django will look for template directories within the app directories. Note that the apps are searched in order of their appearance in the `INSTALLED_APPS` configuration value.
- `OPTIONS` *is a nested dictionary to pass configuration options to the template engine.* The default values for this are sufficient.

By default, the `DIRS` property is an empty `list` and needs to be changed to wherever you decide to put your templates. The most common place to put your templates is in your project folder in a directory named *templates*. Use your file explorer or the
